INTRODUCING SANUM-KEHLBECK

Sanum-Kehlbeck GmbH & Co. KG is a family run company based in northern Germany. It manufactures high quality potentised microbiological remedies as well as herbal, nutritional and pH-balancing products. The biological healing tradition using Sanum remedies is growing amongst medical, dental, veterinary and natural health practitioners worldwide.

Much of Sanum-Kehlbeck's work is based on the pioneering and extensive research of the German microbiologist Prof. Dr. Günther Enderlein (1872–1968) whose main book ***Bacteria Cyclogeny*** was published in 1925. In his 60 year career, Enderlein made profound discoveries about the nature of chronic diseases. He wrote over 500 scientific papers, was a journal editor, lectured internationally and founded the IBICA Institute for microbiological research into health. Enderlein also became the production manager for Sanum, a company formed in 1932 for the manufacture of bacterial remedies for immunobiological health.

Enderlein's major contribution was to pleomorphism, the concept that microbes can assume numerous forms within a developmental cycle, starting from virus-sized particles, progressing to bacteria and then fungi. These microbial forms exist throughout the body from birth and are symbiotic or pathogenic according to the conditions of the inner environment. By contrast, modern medicine rests on the monomorphistic view that microbes exist primarily in one form and mainly attack the body from the outside.

Enderlein observed human microflora by using live blood under a darkfield microscope which enabled him to identify various types of degeneration. He also discovered a natural bioregulatory process by which the inner microbial ecosystem maintains a healthy balance. He identified the regulators as 'symbionts' that restore 'symbiotic equilibrium', which for him represented an ideal state of health. From this insight, Enderlein developed his unique isopathic remedies derived from fungal cultures. Of particular significance for health were the life cycles of ***Mucor racemosus*** and ***Aspergillus niger***, which he discovered to be fundamental to the microflora of all humans and mammals, along with Candida and various species of Penicillium. In any such microbial life cycle, virulent forms can be returned to harmless avirulent forms with the corresponding isopathic remedy.

Enderlein's close confidant for many decades, Mr. Heinrich Kehlbeck, bought Sanum with all its rights and trademarks in 1975 and merged it with the IBICA Institute to create Sanum-Kehlbeck GmbH & Co. KG. Enderlein gave the Kehlbeck family exclusive custodianship of all his original microbial cultures, specialized production knowledge and sole rights to use his work. Sanum-Kehlbeck still retains all the official registrations for these original products. All of Sanum's products comply with EU legislation and are approved by the FDA in America.

The name Sanum is derived from the Latin word 'sanus' meaning healthy. Sanum-Kehlbeck emphasises an ecological approach to health by aiding regulation of the microflora permeating the body. Sanum therapy uses various potentised microbial remedies, supported by nutritional, herbal and pH products, to rebalance the 'soil' out of which diseases emerge. Enderlein described disease primarily as a manifestation of the 'endobiosis' (the Mucor cycle), to which he saw similarities to the psora miasm as defined by Hahnemann. He also described the 'paratuberculosis' (the Aspergillus cycle) as another significant miasm underlying many chronic conditions. Many of the Sanum remedies work at this deep miasmatic level to increase overall constitutional and immune vitality.

Sanum-Kehlbeck is dedicated to research and development, working closely with German and international universities, scientific research institutes and clinics as well as individual medical and natural health practitioners. In addition to the original Enderlein remedies Sanum has developed a number of newer, potentised fungal and bacterial remedies. For example, one of these newly developed ranges is the Sanukehls, which contains potentised 'haptens' based on cell wall polysaccharide extracts from various bacteria and fungi.

Another range of products of historical significance is the Polysans, containing potentised colloids manufactured from the original mother tinctures of Dr. med. Carl Spengler (1860–1937), a noted researcher of tuberculosis and syphilis.

At a time when microbial imbalances and chronic diseases are on the rise, the Sanum remedies have an increasingly significant role to play for the well-being of humans and animals. For further information on Enderleinian microbiology, please refer to the book list.

ENDERLEINIAN MICROBIOLOGY BOOK LIST

BY ENDERLEIN

- BK1409 **Bacteria Cyclogeny**
Professor Dr. Günther Enderlein
(245 pages with 330 illustrations) £ 48.00

Professor Enderlein outlines his comprehensive theory of bacteria cyclogeny. He details the developmental stages of the microbial cycle identified from his rigorous observations using a darkfield microscope. This is Enderlein's major work, originally published in 1925, which has only recently become available in English.

ON PLEOMORPHISM

- BK1410 **Divided Legacy - Vol. 4. The Bacteriological Era**
Harris L. Coulter
(776 pages) £ 40.00

An historical overview of the bacteriological era from 1870 to 1990 including the debate between proponents of monomorphism and pleomorphism with a brief introduction to Enderlein's work.

DARKFIELD MICROSCOPY

- BK1411 **Introduction into Darkfield Diagnostics**
Cornelia Schwerdtle & Franz Arnoul
(163 pages with 106 colour photographs) £ 32.00

An introduction to Enderlein's research, illustrating darkfield microscopy as an invaluable diagnostic tool for uncovering the micro-life found in the blood and how this relates to disease.

- BK1412 **Blood Examination in Darkfield**
Dr. Med. Maria-M Bleker
(80 pages with 80 illustrations and 150 colour photographs) £ 32.00

A summary of Enderlein's theory of bacteria cyclogeny, which provides a systematic description and illustration of the various microbial forms he identified in the blood. These findings are corroborated by Dr. Bleker's experiences in clinical practice. Contains both English and German texts.

NOTES ON SANUM REMEDIES

As with all systems of nature cure, the Sanum remedies can provoke a healing reaction before improvement. To minimise any such aggravation please ensure that your patients are aware of the importance of the eliminatory pathways of the body: the bowels, skin, lymph, kidneys, and lungs. These excretory organs should be functioning as well as possible. In many cases, the Sanum remedies are supported by homeopathic or herbal drainage remedies. Patients new to these remedies can assist detoxification with a naturopathically oriented diet, plenty of pure water, appropriate exercise, colon cleansing, fresh air, sweating and massage.

As a general rule, the more chronic the condition the less a remedy must be administered in terms of quantity, frequency and potency. Starting with a lower dose and working upwards, building up the intake gently, is a good way to ensure that the patient can fully integrate the changes possible.

Be aware that the action of the Sanum remedies can be undermined by anti-microbial medications and strong substances. Also avoid using Sanum remedies at the same time as immunosuppressive medications or treatments and leave an interval of four weeks before or after vaccinations.

THE POLYSAN TEST

The Polysan Test is a simple way to assess constitutional health. Developed by Carl Spengler in Switzerland, the Polysans contain colloids that are derived from serum which has been inoculated with certain pathogenic germs or toxins.

A drop of blood can reveal various latent infections from the individuals life or that have been inherited from previous generations. When antibodies are present in human blood due to former disease, they react with the respective Spengler colloid as an antigen-antibody reaction to diagnose masked infections.

On a clean surface such as a glass slide or plastic sheet, mix one drop of blood with one drop of a Polysan and stir with a cocktail stick (a new one for each drop). Wait for 5 minutes and coagulations of the red blood cells will become visible. The intensity of this agglutination reaction indicates the level of antibody titer present in the body and therefore gives a guideline for treatment accordingly.
